

APM Artificial Intelligence Policy

Purpose

To ensure ethical, responsible, and effective use of Artificial Intelligence (AI) technologies within the APM Group.

Scope

This policy applies to all employees and contracted staff (permanent, temporary and casual) employed across the APM Group. It also applies to all contractors, consultants and other stakeholders of the APM Group while working within APM's environment. 'APM Group' means Ancora TopCo Limited and its subsidiaries.

This policy sets out the guidelines for the use of Artificial Intelligence across the APM Group. Please refer to local legislation for further AI obligations applicable to your specific jurisdiction.

Artificial Intelligence (AI) Definitions

In this policy, 'AI' means the ability of a computer system or software to perform tasks that would normally require human intelligence including learning, reasoning and making decisions.

Artificial Intelligence: there is no single agreed definition of artificial intelligence (AI). As a general term, AI it refers to the ability of machines to perform tasks which normally require human intelligence. The following, more specific AI definitions apply:

- **General-purpose AI:** An AI model that is capable of being used, or capable of being adapted for use, for a variety of purposes, both for direct use as well as for integration in other systems
- **Narrow AI:** AI models focused on defined tasks and uses to address a specific problem. Examples of narrow AI systems include AI assistants such as Apple's Siri or Google Assistant, and many facial recognition tools.
- **Generative AI:** 'an AI model with the capability of learning to generate content such as images, text, and other media with similar properties to its training data' and systems built on such models.
- **Large language models (LLMs)** and **multimodal foundation models (MFMs)** are both examples of generative AI. An LLM is 'a type of generative AI that specialises in the generation of human-like text'. An MFM is 'a type of generative AI that can process and output multiple data types.
- **AI model** the 'raw, mathematical essence that is often the 'engine' of AI applications' such as GPT-4
- **AI system** 'the ensemble of several components, including one or more AI models, that is designed to be particularly useful to humans in some way' such as the ChatGPT app.
- **AI Agent:** An AI system that can perceive information, reason about objectives, make decisions, and take actions to achieve specific goals with limited human intervention.
- **Autonomous Agent:** A type of AI agent capable of independently planning and executing tasks with minimal human oversight, adapting its actions based on changing circumstances and feedback.
- **Agentic AI:** A class of AI systems designed to pursue objectives through planning, reasoning, tool use, and action execution, enabling the completion of complex, multi-step workflows.
- **Multi-Agent System (MAS):** A collection of multiple AI agents that collaborate or operate independently to achieve a common objective through coordination and information sharing.

Ethical AI Use:

While APM understands the benefits that AI can bring to innovation and efficiency, we are committed

- AI must be developed and used in a manner that is fair, transparent, and respects privacy.
- APM commits to avoiding bias in AI decision-making processes. Regular audits by business processes and data owners will be conducted to check for and mitigate any biases.
- Bias and discrimination: As AI systems learn from source data which may contain inherent bias, this bias may be replicated in their outputs through inferences made based on gender, race or age and have discriminatory effects. AI outputs can often appear credible even when they produce errors or false information.
- Other inaccuracies: Issues in relation to accuracy or quality of the training data (including as a result of data poisoning) and the predictive nature of generative AI models can lead to outputs that are inaccurate but appear credible. Feedback loops can cause the accuracy and reliability of an AI model to degrade over time. Inaccuracies in output can have flow on consequences that depend on the context, including reputational harm, misinformation or unfair decisions.
- We commit to avoiding bias in AI decision-making processes and will always have a human in the loop for decision making
- Regular audits by business contract or service lines owners, as well as business process and data owners will be conducted to check for and mitigate any biases when AI is in use.

Approval for use of AI

Businesses must only use AI where the relevant use has been signed off by the member of the ELT for your business, with assessments completed by both your regional Data Privacy and Digital Leaders.

Any business wishing to have AI approved should create a business case and privacy impact assessment, which will be reviewed by your local Digital team in accordance with the APM Group AI approval process, before final business case sign off with the ELT

The impact assessment will take into account what data is being processed and how this data will be hosted and accessed by the AI platform. In some instances, we may also need approval from the Data controller (especially where we are processing government or state data). Under no circumstances should AI be used for any inappropriate purpose, such as:

- Theft of intellectual property (IP) or plagiarism
- Offensive or vulgar content
- Removing a human decision that should not be made by AI (e.g. as to whether a participant retains benefits)
- Reverse engineering or adding third party AI code into APM systems

Before any APM content is fed into an AI Software/Service, a risk review should be undertaken as to how that information may be used and shared with third parties.

Any business case should be signed off and relevant delegation of authority obtained before proceeding with procurement.

AI incidents that involve data loss

An AI data loss incident is defined as any data that is shared within AI that is in breach of an APM contract or regional legislative requirement. If data is shared on an AI platform that is not authorised for use this should be reported to your Data privacy team or management in line with local requirements.

This tends to be data that is Personal Identifiable Information (PII), Client data, IP and commercial sensitive information you are not authorised to share outside of APM.

When personal information is input into an AI system, it may be considered either a **use** of personal information (if the data stays within the organisation's control) or a **disclosure** of personal information (if the data is made accessible to others outside the organisation and has been released from the organisation's effective control).

Training

All staff given access to AI tools should be given training in ethical use of AI tools in line with local legislative and contractual requirements.

Ongoing governance of AI use & accountability

The use of AI should be continually reviewed in line with our commercial and legislative commitments. Each business service line or contract owner must ensure that the use of AI remains in line with any contract changes or customer notification. The data privacy, compliance, cyber security and digital and technology teams will also do regular audit checks to ensure only approved AI is in use.

Ownership: Every shared AI agent, use case or AI deployment must have an explicitly assigned owner who is responsible for its accuracy, relevance and maintenance. If you built it, you own it until it is formally reassigned.

Lifecycle management: Shared agents and AI use cases will be reviewed periodically. Solutions that no longer deliver value or have no active owner will be retired. A central regional Agent register provides visibility of all shared agents, including their purpose, owner and audience.

Auditing and compliance: Data privacy, compliance, cyber security and Digital teams will conduct regular audits across all tiers. Each business service line or contract owner must ensure AI use remains aligned with contract changes and client notification requirements.

Legal / Regulatory

Privacy obligations will apply to any PII input into an AI system and the output data generated by AI. Your country may also have other legislative requirements for AI that you need to understand and comply with, such as cyber security, state secrets, and intellectual property.

Document details

Update this document whenever requirements change and review at least every year.
